B.A. ECONOMICS HONOURS • SEMESTER 6

DEMOGRAPHY

Course Code: ECO6EJ310 • Elective • 4 Credits

MODULE 3

Age and Sex Composition of population

Academic Level: 100–399 **Curriculum:** CUFYUGP 2024 **Publisher:** DegreeLive Academic Press

Module 3: Age and Sex Composition of population

1. Conceptual Scope, Epistemic Frameworks & Curricular Foundations

The advanced academic study of *DEMOGRAPHY* in Module 3 (Age and Sex Composition of population) is governed by the Calicut University CUFYUGP 2024 regulations. This module covers core curricular themes: **Unit 13: Age pyramids: types, concepts of stationary, stable and quasi - stationary population 2; Unit 14: Patterns of sex and age structure in developed and developing countries 2; Unit 15: Age and sex structure in India; Unit 16: Benefits and issues associated with Demographic dividend; Unit 17: Ageing of population**. Economics as a rigorous science synthesizes theoretical abstraction with empirical verification to explain resource allocation, market dynamics, and developmental trajectories.

In Semester 6 coursework, honours students engage with advanced theoretical controversies, econometric testing, and empirical policy design. Developing mastery across these dimensions provides the analytical training essential for postgraduate scholarship and professional economic analysis.

2. Formal Analytical Models, Mechanics & Mathematical Formulations

To ensure precision and empirical verifiability, fundamental mathematical formulations governing Age and Sex Composition of population are presented below with explicit human-readable variable definitions:

Crude Birth Rate (CBR)

$$CBR = \frac{B}{P} \times 1000$$

Where: CBR = Live births per 1,000 population per year, B = Total live births registered, and P = Mid-year total population.

Total Fertility Rate (TFR)

$$TFR = 5 \times \sum_{i=1}^{7} ASFR_i$$

Where: TFR = Average number of live births per woman across reproductive lifespan, computed as 5 times the sum of age-specific fertility rates (ASFR).

Dependency Ratio Formula

$$DR = \frac{P_{0-14} + P_{65+}}{P_{15-64}} \times 100$$

Where: DR = Ratio of economically dependent age cohorts (0–14 and 65+) per 100 active working-age individuals (15–64).

Understanding the formal mathematical foundations and underlying behavioral assumptions enables researchers to quantify relationships, test empirical hypotheses, and evaluate policy trade-offs rigorously.

Degreelive

3. Thematic Analysis and Institutional Foundations

1. Formal Demography and Demographic Transitions

Demography studies the size, composition, territorial distribution, and dynamics of human populations. The Demographic Transition Model describes the historical progression from high birth and death rates to low birth and death rates through industrialization and healthcare expansion.

2. India's Demographic Dividend and Population Policy

India is currently experiencing a historic Demographic Dividend, with over 65% of its population in the working-age bracket (15–64). Harnessing this demographic window requires substantial public investments in human capital, skill development, public health, and productive formal employment creation.

4. Empirical Methodologies, Econometric Testing & Data Verification

Empirical rigor is indispensable to modern economics. When evaluating Age and Sex Composition of population, economists employ diverse quantitative methodologies:

- **Econometric Modeling and Diagnostic Verification:** Rigorous regression modeling requires verifying classical assumptions—testing for heteroscedasticity, autocorrelation, and multicollinearity—before drawing policy inferences.
- **Time-Series and Cointegration Techniques:** Analyzing macroeconomic variables requires testing for unit roots (ADF tests) and cointegrating relationships (Johansen procedure) to capture long-run equilibrium dynamics.
- **Micro-Econometric Policy Evaluation:** Quantitative policy assessments utilize quasi-experimental designs (Instrumental Variables, Propensity Score Matching, and Difference-in-Differences) to measure causal treatment impacts.

5. The Indian Context, Sectoral Analysis & Policy Implementations

In India, advanced economic theory intersects with unique structural realities: rapid service-led growth, persistent agrarian employment burdens, regional developmental divergence, and significant technological modernization.

In monetary and fiscal policy, the interplay between the Reserve Bank of India and the Ministry of Finance balances inflation control under the Flexible Inflation Targeting framework with the imperative for capital investments under the National Infrastructure Pipeline (NIP).

6. Comparative Matrix of Analytical Frameworks

The comparative matrix below outlines the primary dimensions, theoretical mechanisms, and practical outcomes encompassing Module 3 (Age and Sex Composition of population):

DegreeLive

Analytical Dimension	Theoretical Mechanism	Operational Manifestation	Socio-Economic Impact & Trade-Offs
Theoretical Foundations	Equilibrium Modeling & Micro-foundations	Mathematical optimization and behavioral incentives	Establishes internal logical consistency and clarifies behavioral trade-offs.
Empirical Estimation	Econometric Testing & Inference	OLS regression, diagnostic checks, and hypothesis testing	Quantifies structural elasticities and eliminates confounding biases.
Institutional Governance	Statutory Frameworks & Regulation	Independent councils, statutory targets, and transparent oversight	Anchors long-term credibility while preserving democratic legislative accountability.
Developmental Outcomes	Inclusive Structural Transformation	Targeted investments, human capital development, and formalization	Accelerates sustainable economic growth and fosters equitable human development.

7. Critical Perspectives & Future Research Horizons

Advanced economic research demands critical reflection on model assumptions. Economists recognize that structural complexities, behavioral biases, and institutional frictions can diverge significantly from stylized theoretical benchmarks, requiring continuous empirical testing and methodological innovation.

8. Pedagogic Review & Module Summary

Module 3 (Age and Sex Composition of population) provides an integrated theoretical and empirical framework for understanding advanced dimensions of DEMOGRAPHY. Students must synthesize theoretical principles, mathematical formulations, and empirical evidence to evaluate economic policy decisions objectively.

Advanced Analytical Exposition & Sectoral Case Analysis (Part 1)

To further advance scholarly comprehension of *DEMOGRAPHY*, specifically regarding the core themes of Module 3 (Age and Sex Composition of population), this extension examines advanced empirical methodologies, structural transitions, and micro-foundational mechanisms that govern modern economic systems under the Calicut University curriculum.

1. Dynamic Structural Adjustment and Behavioral Foundations

Modern economic theory emphasizes that macroeconomic aggregates arise from decentralized optimizing behavior. Households, enterprises, and financial intermediaries make choices under forward-looking expectations, information asymmetries, and institutional frictions. When assessing Age and Sex Composition of population, economists must consider how changes in structural parameters—such as technology shocks, regulatory updates, interest rate shifts, and demographic trends—alter equilibrium pathways over time. The interaction between nominal rigidities and real market frictions frequently delays price clearing, resulting in prolonged adjustment periods that policy interventions attempt to stabilize.

In developing economies, dynamic structural adjustment is further complicated by credit market imperfections, informal employment, and dualistic factor markets. As capital accumulation progresses, factor reallocation from low-productivity traditional activities to high-productivity modernized sectors drives

structural transformation. Understanding this structural mobility requires analyzing relative factor prices, elasticity of factor substitution, and the distributional consequences of technical change.

2. Empirical Sectoral Case Study & Evidence-Based Policy Synthesis

Empirical evidence drawn from contemporary economic transitions illustrates how theoretical frameworks apply to complex developmental environments. In developing and emerging economies like India, the transition from administrative controls toward market-determined allocations has necessitated modern regulatory architectures across banking, industry, agriculture, and international trade.

Quantitative assessments utilizing regression discontinuity designs and synthetic control methods demonstrate that institutional credibility is paramount. For instance, when regulatory rules are transparent, predictable, and shielded from political interference, long-term investments expand, the cost of capital declines, and private enterprise flourishes. Conversely, arbitrary discretionary interventions create uncertainty, depress domestic capital accumulation, and distort market efficiency.

In contemporary macroeconomic practice, policy authorities increasingly rely on forward guidance and transparent communication frameworks. By clearly delineating reaction functions and underlying economic forecasts, policymakers can anchor market expectations, reduce risk premia in sovereign bond markets, and minimize financial volatility during external economic shocks.

3. Multi-Dimensional Analytical Comparison Matrix

The comparative matrix below evaluates the structural trade-offs, theoretical implications, and policy outcomes associated with varying economic paradigms relevant to Module 3:

Analytical Dimension	Theoretical Mechanism	Operational Manifestation	Socio-Economic Trade-Off & Impact
Institutional Credibility	Rules vs. Discretion in Policy	Independent regulatory councils, statutory targets, and transparent mandates	Eliminates dynamic inconsistency; anchors investor confidence at the expense of short-term policy flexibility.
Market Efficiency	Price Discovery & Clearing	Deregulated commodity pricing, electronic trading exchanges, and digital logistics	Maximizes consumer and producer surplus; requires targeted safety nets for vulnerable households.
Fiscal & Monetary Interplay	Policy Mix & Debt Sustainability	Coordinated deficit management, public debt issuance, and liquidity management	Prevents fiscal dominance over the central bank while supporting public infrastructure investments.
Redistributive Equity	Welfare Economics & Social Choice	Direct benefit transfers, progressive taxation, and universal basic public services	Reduces Gini coefficient and multidimensional poverty; requires robust tax buoyancy to fund expenditures.

4. Epistemological Implications for Economic Research

Undergraduate honours research in economics demands an unwavering commitment to methodological rigor. Scholars analyzing Age and Sex Composition of population must evaluate empirical findings critically, cross-examine data collection integrity, acknowledge model limitations, and synthesize multiple economic traditions to formulate nuanced, evidence-based policy recommendations that foster equitable and sustainable economic growth.

Ultimately, economic inquiry is validated not by formal mathematical elegance alone, but by its capacity to explain empirical realities and enhance human welfare. By cultivating deep familiarity with theoretical literature, institutional architectures, and quantitative methods, students emerge equipped to navigate the economic challenges of the twenty-first century.
